User flow

Approved screen journey and the decision states required for implementation.

Mohamed Salem - 25058911 | Individual submission | MTM4681

Main demonstration path

The sign-in controls simulate access to My Work. Active incidents opens the Inbox incident update. Follow verification currently leads to the Queue review example, which links to the upstream example PR. The Agent tab opens conversations; a conversation opens the illustrative chat, and View proposed fix returns to Queue.

Navigation contract

Home maps to My Work; Inbox maps to incident updates; Queue maps to fix review; Agent maps to conversations and chat. The selected tab remains consistent with the current area. In the proposed app, detail screens preserve their parent tab and expose an explicit back action.

Solid paths above summarize the demonstrated journey. The decision paths on page 2 are planned behavior and are not all implemented as Figma interactions.

Decisions and recovery

Required states beyond the successful demonstration path.

Decision / trigger	Expected path
Authentication succeeds?	Yes: My Work. No: stay on sign-in, explain the error and allow retry. GitHub authorization must return through a registered application callback.
Network available?	Yes: fetch current state. No: show cached information with a visible stale timestamp; disable actions that require the server and offer retry.
Incidents available?	No: show an empty state and refresh. Yes: list by severity, then recency; retain database/API type and service context.
Existing live PR?	Yes: open its verified summary rather than create a duplicate. No: follow the incident verification workflow.
Verification passed?	No: retain the incident, show failed checks and reason, and allow a controlled retry. Yes: show measured evidence and delivery state.
Live delivery confirmed?	Yes: enable Open pull request. Simulation only: label the outcome as simulated and do not offer a fabricated live PR URL.
Agent reply available?	Show a scoped, incident-linked reply with evidence. On failure, preserve the user message and offer retry. Future agents remain disabled and labeled Coming soon.

Engineering workflow behind the screen

Detected incident → diagnosis → candidate generation → isolated verification → verified / failed → live PR or simulated result. A failed check may trigger a bounded backend retry. An existing PR can short-circuit duplicate generation. Neither a passed test nor a PR implies deployment or resolution.

Prototype limitations and next validation

The current successful path uses sample incidents and a recorded database result. Authentication, sending chat messages, full failure variants and system back behavior still require implementation or additional prototype states. Final presentation testing should check every linked control, tab selection and external destination.

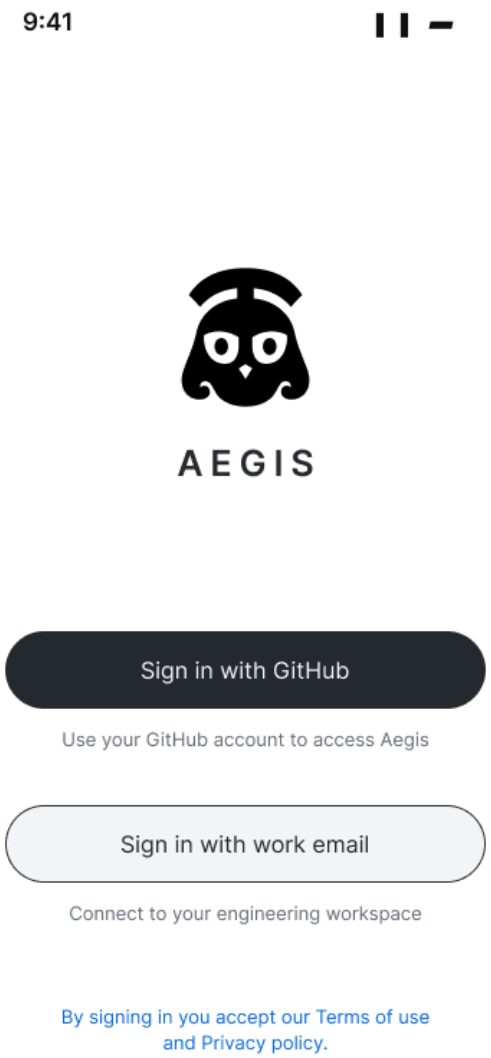

Enter and find your work

01 → 02 · Sign in, then choose an incident or proposed fix.

Mohamed Salem - 25058911 | Individual submission | MTM4681

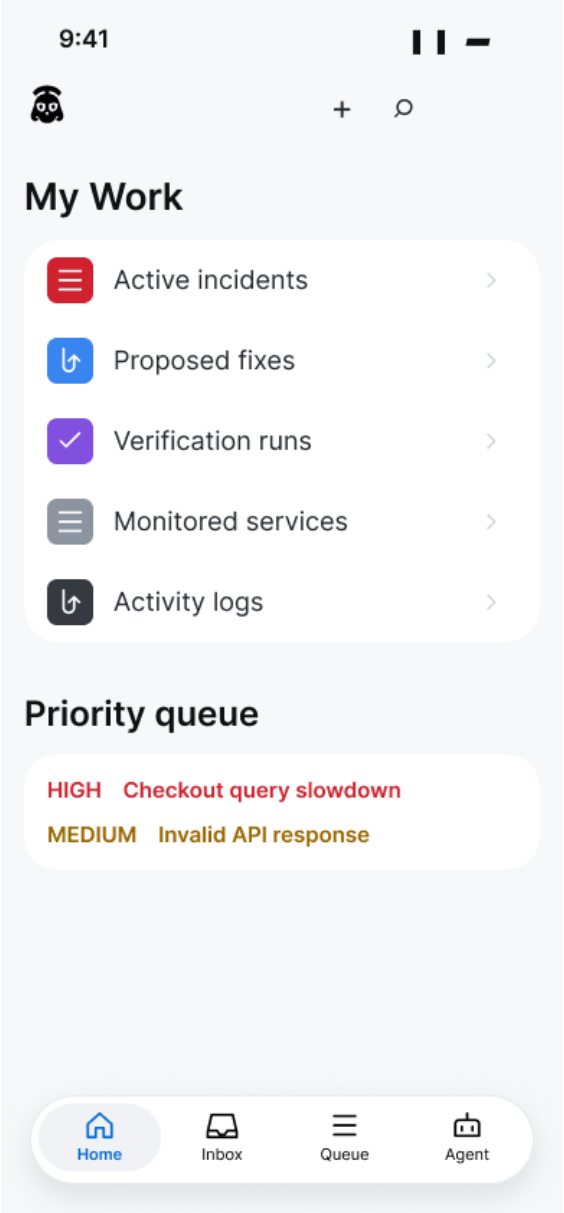

Ahmed Harib | External contributor (outside the university) | Backend author

01 · Sign in

Entry point. Sign in with GitHub or work email leads to 02 My Work. Authentication is simulated in this prototype.

02 · My Work

Home. Select Active incidents to open 03 Inbox, Proposed fixes to open 04 Queue, or Agent to open 05 Conversations.

Screens are numbered to match the flow diagram. Click a screen image to open its editable Figma frame.

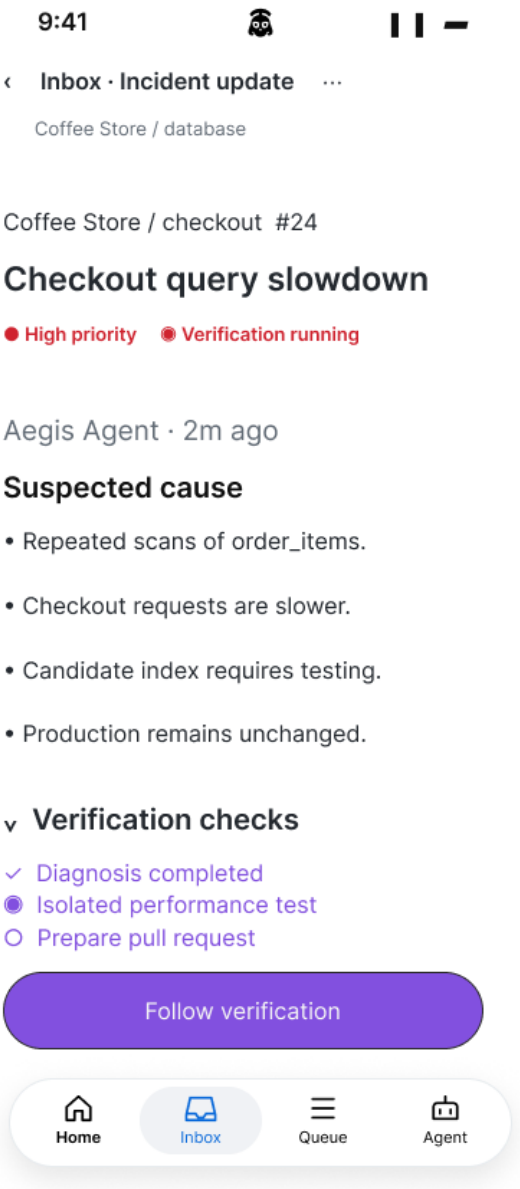

Investigate and review

03 → 04 → GitHub · Understand the incident before reviewing its candidate fix.

Mohamed Salem - 25058911 | Individual submission | MTM4681

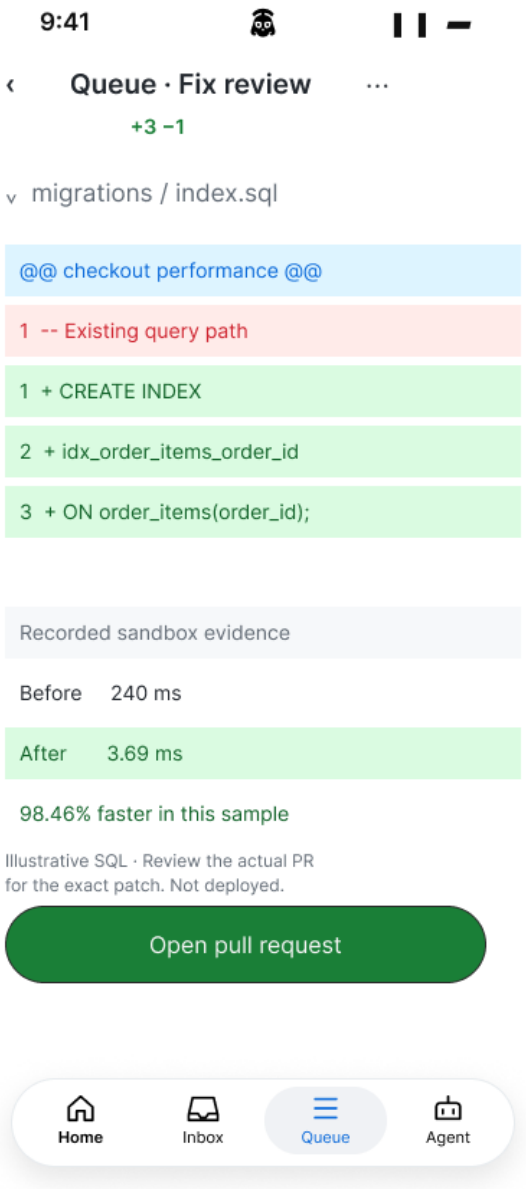

Ahmed Harib | External contributor (outside the university) | Backend author

03 · Inbox incident update

Inbox. Inspect symptoms, suspected cause and checks. Follow verification leads to the recorded Queue example (04).

04 · Queue fix review

Queue. Review the illustrative change and recorded evidence. Open pull request launches external GitHub review.

Screens are numbered to match the flow diagram. Click a screen image to open its editable Figma frame.

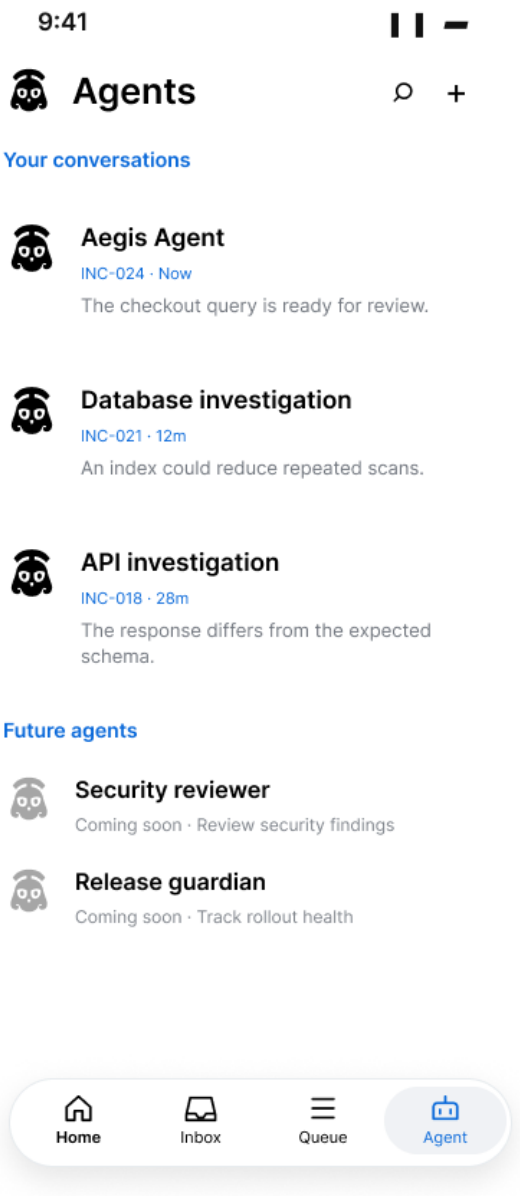

Ask the agent

05 → 06 → 04 · Open a conversation and return to its proposed fix.

Mohamed Salem - 25058911 | Individual submission | MTM4681

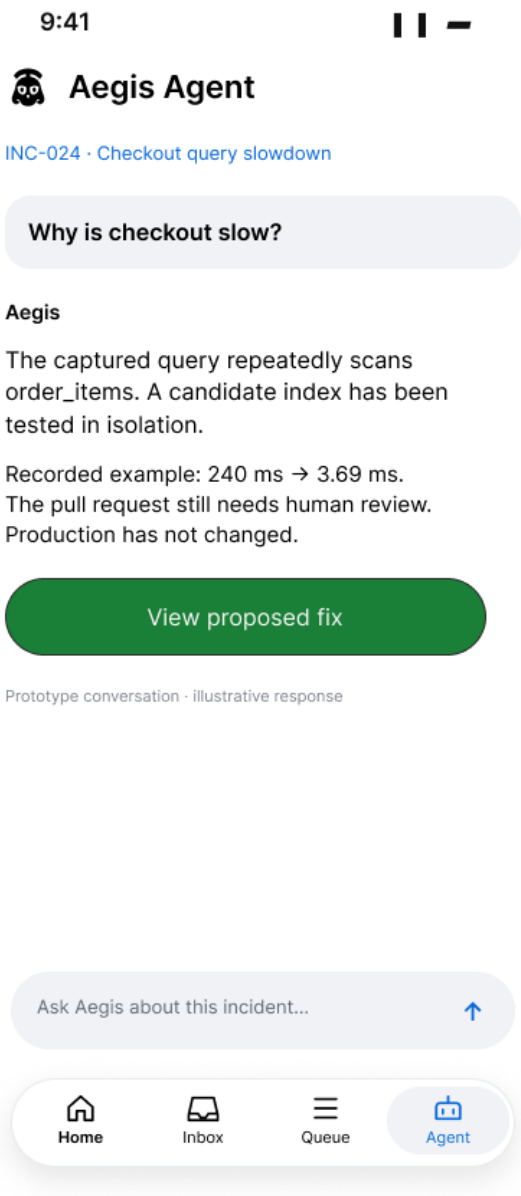

Ahmed Harib | External contributor (outside the university) | Backend author

05 · Agent conversations

Agent. Choose an incident conversation to open 06 Chat. Future agents are labeled Coming soon.

06 · Agent chat

Chat. Read the illustrative reply and select View proposed fix to return to 04 Queue. Message sending is proposed.

Screens are numbered to match the flow diagram. Click a screen image to open its editable Figma frame.
